2. This REPORT consists of a total of 3 sheets, including this cover sheet.					
This report is also accompanied by ANNEXES, i.e., sheets of the description, claims and/or drawings which have been amended and are the basis for this report and/or sheets containing rectifications made before this Authority (see Rule 70.16 and Section 607 of the Administrative Instructions under the PCT).					
These annexes consist of a total of sheet(s).					
3. This report contains indications relating to the following items:					
I X Basis of the report					
II Priority					
III Non-establishment of opinion with regard to novelty, inventive step and industrial applicability					
IV Lack of unity of invention					
V X Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement					
VI Certain documents cited					
VII Certain defects in the international application					
VIII Certain observations on the international application

## NOVELTY (N) AND INVENTIVE STEP (IS) claims 1-28

The invention of the claims is a hybrid lighting system comprising at least one light collector for generating an output of fluorescent light, the light collector comprising an optically transmissive material that is doped with dispersed dye molecules which are arranged to absorb incoming light and to emit fluorescent light; and at least one electrically powered light emitting device that, in use, supplements the output of the light collector to providing light of predetermined spectral characteristic.

No individual citation or obvious combination of citations disclose or fairly suggest such a hybrid lighting system. The closest art of EP 0224448 discloses a luminous energy transmission device where sunlight and electrically powered light are mixed. However, this device appears to be a different application as it only collects natural sunlight itself, rather than a system that converts incoming light to fluorescent light by a light collector comprising an optically transmissive material that is doped with dispersed dye molecules, and supplements the fluorescent light output with electrically powered light. Also, the prior art device simply combines electric light with natural light when the latter is insufficient - this appears to merely serve the purpose of increasing the total light intensity, which differs from the present invention that supplements fluorescent light with electrically powered light of at least one particular colour to provide light of a predetermined spectral characteristic.
